

WeatherPy

Starter Code to Generate Random Geographic Coordinates and a List of Cities

```
In [1]: # Dependencies and Setup
import matplotlib.pyplot as plt
import pandas as pd
import numpy as np
import requests
import time
from scipy.stats import linregress

# Import the OpenWeatherMap API key
from api_keys import weather_api_key

# Import citipy to determine the cities based on latitude and longitude
from citipy import citipy
```

Generate the Cities List by Using the `citipy` Library

```
In [13]: # Empty list for holding the latitude and longitude combinations
lat_lngs = []

# Empty list for holding the cities names
cities = []

# Range of Latitudes and Longitudes
lat_range = (-90, 90)
lng_range = (-180, 180)

# Create a set of random lat and lng combinations
lats = np.random.uniform(lat_range[0], lat_range[1], size=1500)
lngs = np.random.uniform(lng_range[0], lng_range[1], size=1500)
lat_lngs = zip(lats, lngs)

# Identify nearest city for each lat, lng combination
for lat_lng in lat_lngs:
    city = citipy.nearest_city(lat_lng[0], lat_lng[1]).city_name

    # If the city is unique, then add it to our cities list
    if city not in cities:
        cities.append(city)

# Print the city count to confirm sufficient count
print(f"Number of cities in the list: {len(cities)}")
```

Number of cities in the list: 628

Requirement 1: Create Plots to Showcase the Relationship Between Weather Variables and

Latitude

Use the OpenWeatherMap API to retrieve weather data from the cities list generated in the started code

```
In [4]: # Set the API base URL
url = "http://api.openweathermap.org/data/2.5/weather?units=Imperial&APPID=" + wea

# Define an empty list to fetch the weather data for each city
city_data = []

# Print to Logger
print("Beginning Data Retrieval")
print("-----")

# Create counters
record_count = 1
set_count = 1

# Loop through all the cities in our list to fetch weather data
for i, city in enumerate(cities):

    # Group cities in sets of 50 for logging purposes
    if (i % 50 == 0 and i >= 50):
        set_count += 1
        record_count = 0

    # Create endpoint URL with each city
    city_url = url + "&q=" + city

    # Log the url, record, and set numbers
    print("Processing Record %s of Set %s | %s" % (record_count, set_count, city))

    # Add 1 to the record count
    record_count += 1

    # Run an API request for each of the cities
    try:
        # Parse the JSON and retrieve data
        city_weather = requests.get(city_url).json()

        # Parse out latitude, longitude, max temp, humidity, cloudiness, wind speed
        city_lat = city_weather["coord"]["lat"]
        city_lng = city_weather["coord"]["lon"]
        city_max_temp = city_weather["main"]["temp_max"]

        city_clouds = city_weather["clouds"]["all"]
        city_wind = city_weather["wind"]["speed"]
        city_country = city_weather["sys"]["country"]
        city_date = city_weather["dt"]

        # Append the City information into city_data list
        city_data.append({"City": city,
                          "Lat": city_lat,

Discussion about the linear relationship:

The linear regression in the northern hemisphere plot above demonstrates that the maximum temperature of the cities decreases as the location of the city becomes further and further from the equator. While the southern hemisphere plot demonstrates that the maximum temperature of a city will increase as the location becomes closer to the equator.

Humidity vs. Latitude Linear Regression Plot

The R-squared is: -0.05790163553635554

Discussion about the linear relationship:

Both plot depicted a small decline in humidity as they moved southward. Correlation was relatively low in either case. Both depicted the majority of their humidity readings at above 60%

The R-squared is: 0.0031349272949599974

Discussion about the linear relationship:

Both plot depicted a small rising in cloudiness as they moved northward. Correlation was relatively low in either case. Both depicted a moderate number of complete cloudiness .
